

(1) $\mathbb{P}^b(\text{MO}_2)$: corners fill it

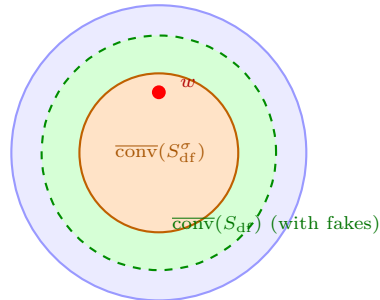

every state is a mixture
of the 4 corners $\Rightarrow$ **no contextual state**

(2) Pentagon: a state pokes out

odd-cycle corners obey $\sum s(a_i) \leq 2$;
 w has $\sum = \frac{5}{2} \Rightarrow$ **outside the hull = contextual**

(3) σ -essential: the leak

w is inside the hull of *all* corners (a fake catches it),
but **outside** the hull of the σ -additive corners.
The leak lives in the **annulus** – and no finite face sees it.
